

POLIDURA

Recrystallizing powder

Specifications

General information: For the first time, there is a newly developed product for the recrystallization of marble and limestone surfaces based on a powder preparation (not containing any waxes or polymers). The application of **POLIDURA** is very easy and it provides for a perfect and even shine to all marble and limestone surfaces that have become mat and lustreless.

Special note: **POLIDURA** is a recrystallizing product perfectly suited to be applied in conjunction with our stone-hardening product **ESTREMADURA**®. So, even the subsequent treatment with **POLIDURA** does not at all reduce the surface-hardening effect of **ESTREMADURA**®.

Application: The surface to be treated must be clean, dry and free of grease. It might be necessary to clean the stone flooring with a preliminary cleaning product before applying the recrystallizing powder. Moisten the stone surface with water first before evenly spreading the **POLIDURA** recrystallizing powder. We recommend to apply approx. 100 g to 1 square meter. Use a single-wheel polishing machine with mounted polishing pad or polishing felt and move it three to five times in slow and even crossed lines over the flooring. Subsequent to this application, vacuum-clean the remaining mud. Neutralize and clean the flooring with pure water and, if necessary, polish it once again using a fresh polishing disk and pure water. Remove the residues with a water vacuum.

Warnings:

- **POLIDURA** recrystallizing powder in conjunction with water has a pH of 2 to 3, and is thus an aggressive substance.
- It is absolutely necessary to appropriately protect and cover adjacent building parts and furniture.
- Avoid contact with skin or eyes. If contact occurs nevertheless, generously flush the eyes with water. Always wear gloves when working with the product.
- The manufacturer will not be liable for any damage resulting from wrong application.

Delivery lot: Plastic container of 5 kg.
